

#### Purpose

The primary purpose of this study was to identify the presence of cancer misinformation through a surveillance strategy of web scraping using social media and the web sources.

### Background

The popularity of social media simultaneously presents new opportunities and problems for the delivery of accurate cancer information. From its onset, social media was viewed to reinforce the in-person messages for medical and public health professionals. However, the growing reliance on social media for information, coupled with elevated distrust in scientists, public health, government organizations, and the pharmaceutical industry has given rise to increase exposure to online cancer-related and science misinformation. The medical and public health community is ill prepared in the counteracting of cancer misinformation in two ways.

First, the pandemic showed the health decision making is not solely about the presenting of facts and evidence but can be linked to larger societal conflicts and conspiracy theories. Second, the recent pandemic illustrated that health professionals were often unprepared to deal with the volume and rapidity of messages put into the information ecosystem by their opposition. As the spread of cancer misinformation through social media and the internet increases, the need for medical and public health messages and risk communication strategies that are intended to migrate the harmful impacts of cancer misinformation and disinformation among populations that experience health disparities is critical.

# Culturally Tailored Communication to Reduce the Spread of Cancer Misinformation and Disinformation

**Richard Rogers, PhD, BA, Department of Criminal Justice Youngstown State University** 

#### Methods

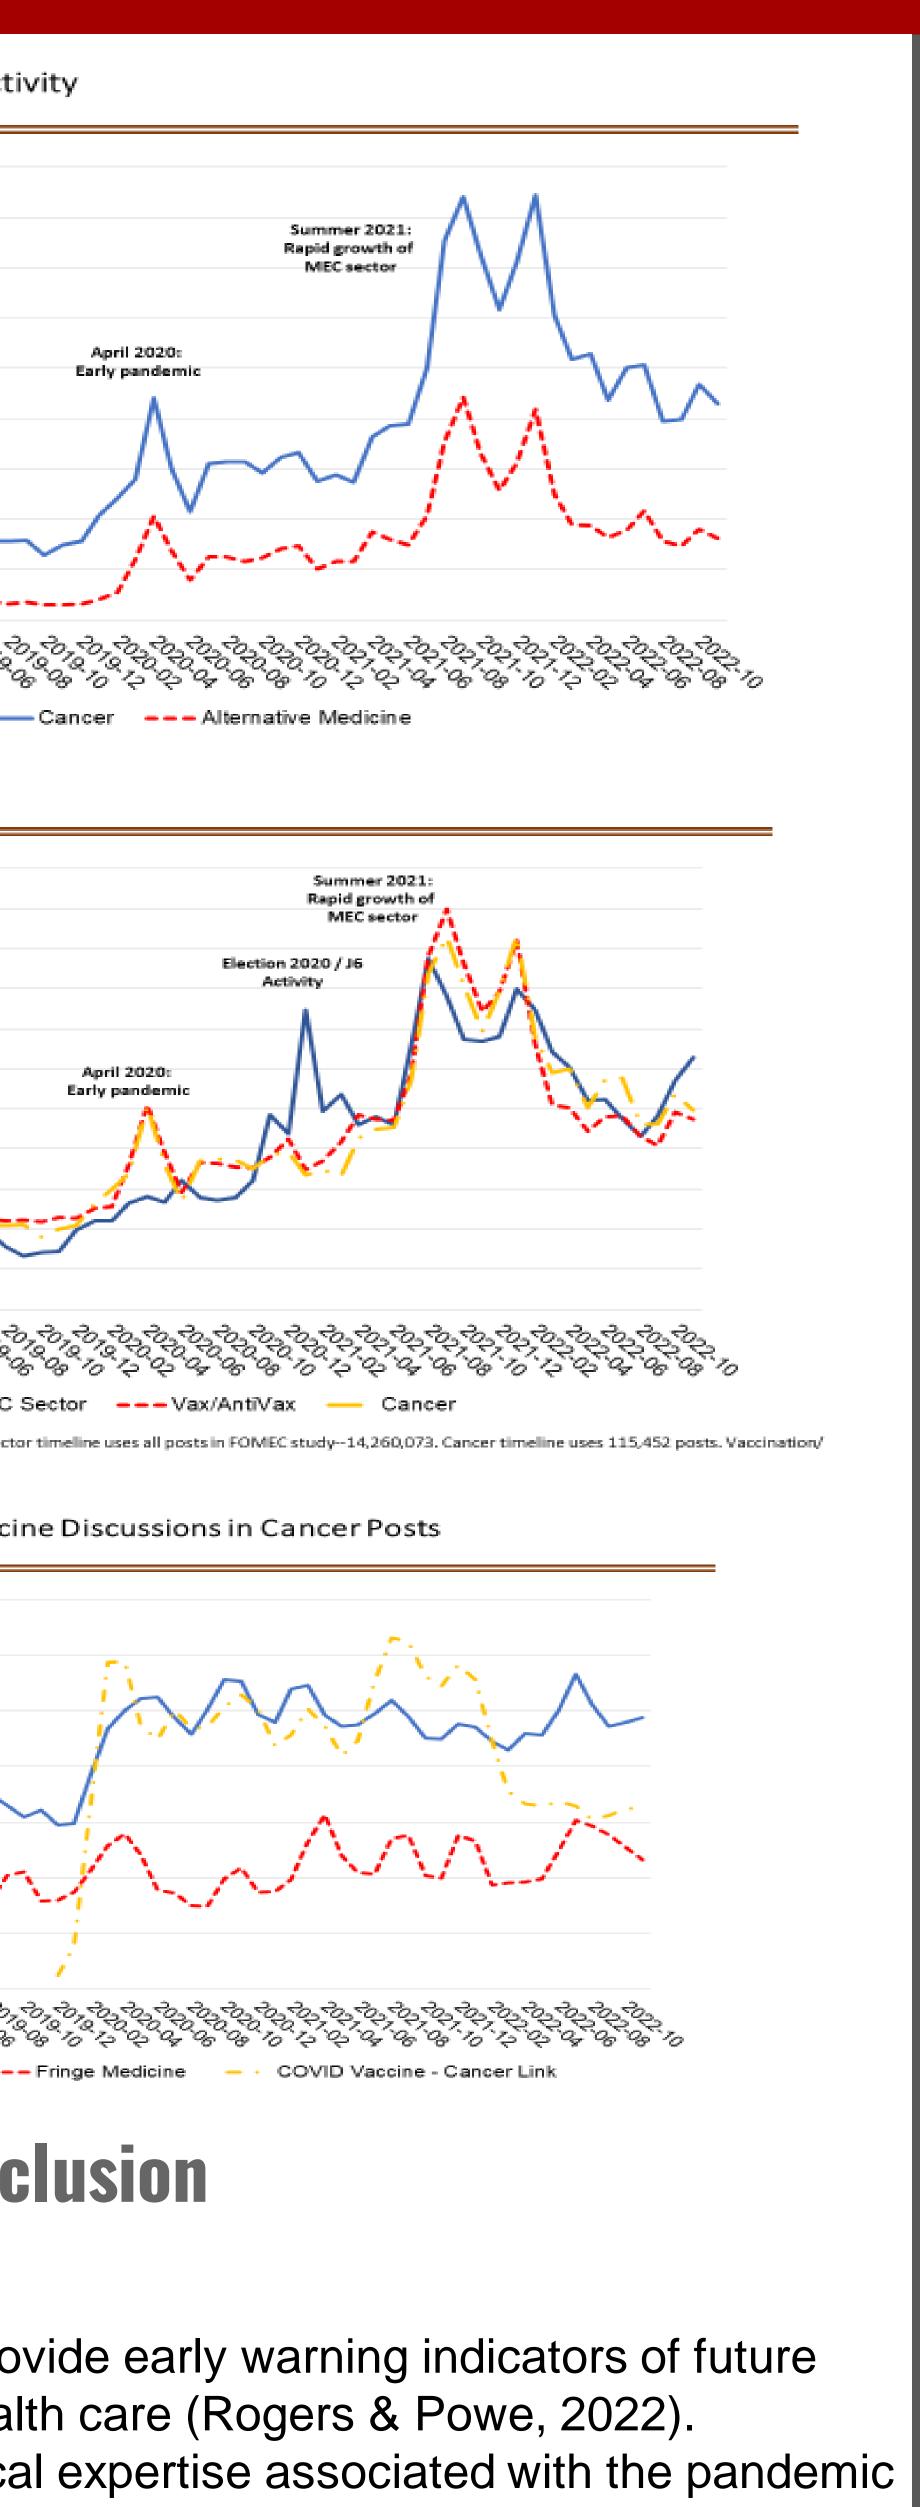

- Frames of Misinformation, Extr Conspiracism (FOME) project State University collects posts purposive sample of 14 social and discussion forums known of the MEC sector.
- Over 14 million posts have bee back to April 2018. Approximat material is health related. Direct cancer were found in 115,452
- Program code can be found at https://rogersperspectives.com
- Data processing supported by from the Ohio Supercomputer

## Results

- Peaks in the growth of cancer found in April 2020 (early pand sharp increase of MEC activity (Figure 1).
- Cancer discussions paralleled sector as a whole and vaccinat discourse as a whole (Figure 2)
- How the pandemic changed dis cancer (Figure 3).
- Emphasis on wellness rose wit Ο pandemic and has remained at
- Fringe medicinal ideas continue
- Cancer occurrence linked to the  $\bigcirc$ vaccine. This point declines as discussions diminish.
